(54) Title: A METHOD AND DEVICE FOR AUDIENCE MONITORING ON MULTICAST CAPABLE NETWORKS

(57) Abstract: The presented idea is a cheap solution for audience monitoring in multicast capable networks e.g. Ethernet, IP or UMTS. There is no need for user equipment in order to monitor the viewers' watching behavior. The measurement is done in the operator's network; therefore, there is no need to contact the end user. The idea can be applied in systems comprising multicast capable network contention server, network devices and user equipment. The content is carried in data packets to the end user. The network devices are remote manageable. The user can choose between several contents. The aim is to measure the user statistics regarding the chosen content. According to the invention it is enough to place a measurement host with our proposed software block in the network, which collects data from the network devices in the edge of the network periodically in order to make a content access survey.
